

Point protection

The direction and deployment of the fog in point protection is illustrated with the arrows. After the first, instant protection of the most valuable items (1) the fog spreads to the rest of the room (2). Walls and floors effectively make the fog "bounce" in all directions.

Total protection

Total protection with fog is only about one thing: To deploy as much fog as possible into the room to ensure everything is covered as fast as possible. The number of fog cannon and their capacity is calculated in accordance with the architecture, and to the size of the room and furnishings.

Point protection or full protection?

Point protection and full protection/total protection are two principles for covering premises with security fog to avoid theft. The design of the rooms, what the valuables are and where they are placed is decisive for your choice of method.

Point Protection: Instant protection of the valuable items first

With point protection the valuables are - in only 5 seconds - wrapped in a dense, opaque and white veil of dry, harmless protective fog. Point protection is ideal when you want to secure parts of a room - e.g. instantly covering strongboxes, jewellery showcases, cigarettes, spirits, and including the car dealer's key case etc.

Among others; Boots The Chemist use the technique of point protection to protect displays of expensive makeup and perfume products. Additionally, Screwfix and many other DIY shops use point protection to protect expensive electric power tools.

The additional effect of point protection

In less than 20 seconds the fog will spread to other parts of the room. Depending on the size of the room and the fog cannon' output capacity, it can cover and protect the whole room! If the room is very large, additional PROTECT Fog Cannon can be installed for instant, full protection. Full coverage with both point protection and full protection creates the most difficult conditions for the burglar.

Full protection is like an impenetrable barrier

Besides point protection, you can also choose to get full protection of a room or a building. Full Protection can be obtained by one, or multiple fog cannon units. Even the biggest production buildings and store rooms can be totally protected with fog. Full protection is used particularly in warehouses and in office blocks, but can be used in all industrial and business premises.

If the problem is ram raiding or vandalism, then use full protection with fog to prevent the intruders from seeing anything and being able to navigate the premises.
